Risk: A risk associated with our product is the chance that team members will be swamped with their classes and not put in the work necessary to set our team apart.

Probability: This is a high probability. The return of in-person classes and social life are definitely obstacles that will impede on the progess of this project.

Effect: With a productivity drop-off, the project can come to a standstill, meaning that only one or two members will be doing the work of all 4.

Strategy:  It is important to start the team at a high rate of productivity, and attempt to maintain the rate of production among all members, to account for the focus drop-off that the members will experience upon the ramp up of other classes and exams. If the project can be done quickly at first, and then just make small changes later, then there will not be as much urgency and stress as the deadline comes around.
